

Fender Lace Sensor Gold Noiseless Single Coil Guitar Pickup Cream Cover - Good Condition

Model : -

Manufacturer : -

Fender Lace Sensor Gold Noiseless Single Coil Pickup Cream Cover. Only £37.95. Perfect Working

Order Slightly faded writing and cover, yet this does not affect the amazing quality or use of the pickup

Description: Here we have an excellent Fender Lace Sensor Gold pickup, usable on any Strat you'd like. The Fender

Lace Gold's were the original noiseless pickup, and a Fender exclusive for almost 20 years. They are excellent

sounding, nailing the early Strat tones, all without the noise. These pickups were so striking that Clapton put them in his

signature Strat. The Lace Sensor family has a unique radiant Field Barrier system that surrounds both the coil and

magnets, reducing annoying 60-cycle hum. The patented Lace Micro Combs replace traditional bobbins, yielding a

wider tonal range and better string balance than traditional pickups. Unlike ordinary pickups, Lace Sensors generate 36

separate magnetic "sensing" fields which, in the areas where they contact the string, "read" the

string's vibration. (Regular pickups only generate anywhere from 4 to 12 fields). Lace Sensors also have

Radiant Field Barriers: metal slides which frame the inner core of the Sensors and perform two functions. The first is to

shield the Sensor from the outside noise and 60 cycle hum. The second is to produce a broader yet more concentrated

umbrella of sensing field that standard magnetic pickups. Less Noise, More Harmonics As compared to

standard pickups, sensors read a greater physical area of the string, while picking up less outside interference. This makes

the signal-to-noise ratio nothing short of phenomenal for a single coil system. Also, a wider range of harmonic content is

read by the Sensor, delivering a more complex tonal response. Increased Sustain, Truer Pitch Since they operate

so efficiently, Lace Sensors can utilize the much lower energy magnets than ordinary pickups, and this in turn brings about a

whole new realm of properties. In regular pickups, the magnetic fields are so strong they physically dampen, or drag

on, the string's vibration, reducing sustain and actually changing the pitch. But in Lace Sensor, string dampening is

virtually nonexistent. This means your sustain is increased dramatically while the string holds its true pitch for the

duration of the note.
